

You **must** use **Netbeans 16.0**. The Netbeans 16.0 is accessible in lab computers (the linux computers) via **Applications -> Programming -> NetBeans 16.0** (this Netbeans has been configured to work with AZUL JDK 19 with JavaFX).

To create a Netbeans Java project, click on **File > New Project**. You should get a dialog-box shown in the figure below. In this dialog-box, you must select “**Java with Ant**” in the **Categories** column, and then you must select “**Java Application**” in the **Projects** column. You **must** do this **regardless of** whether your new project will contain non-GUI java code **or** GUI specific JavaFX based java code.
